

<Broccoli Super Sprouts>

Murakami Farm's Broccoli Super Sprouts is a carefully selected, dedicated variety of broccoli that is harvested on the third day of growth and contains over 20 times (400mg/100g) the beneficial compound "sulforaphane" compared to regular mature broccoli, showcasing its impressive health benefits. The product was developed by Dr. Paul Talalay from Johns Hopkins University School of Medicine. Only Murakami Farm holds the exclusive rights to produce and distribute products in Japan. Recently, as consumers have become more and more health-conscious, their interest in the amount of sulforaphane contained in products is also increasing, and the product's shipment volume has increased about fivefold over the last decade. Broccoli Super Sprouts is produced in leading-edge plant factories using advanced cultivation techniques throughout the year, and high-quality sprouts containing a stable amount of sulforaphane are being shipped.
